AutoCAD is available in three types of "trifold" system, which means it has a specific adaptation to handle: AutoCAD application package AutoCAD operating system AutoCAD printer driver AutoCAD can be run on an Intel compatible machine with Microsoft Windows, on a Macintosh, and on a Linux machine. It is also available on the Microsoft Windows Embedded operating system. AutoCAD 2010 and older versions can be installed directly on any X86-based computer running Windows, but newer releases require a compatible operating system. AutoCAD 2010 can also be installed on a server running Linux or Unix. AutoCAD Professional and Professional Extended have supported dual processor technology since AutoCAD 2009, allowing installation on dual core machines. AutoCAD LT, however, is not supported on dual processor. AutoCAD LT 2008 R1 is also not supported on dual processor. A research team at the University of Adelaide has discovered a new gene that may be responsible for the increased risk of Alzheimer's disease in Down syndrome. By sequencing the entire genomes of 96 brains from young and older people with Down syndrome, researchers from the University's Adelaide Medical School have found that individuals with Down syndrome have the same number of genes as the general population, but tend to have a small proportion of their genes affected by the genetic instability present in Down syndrome. They found that in young people with Down syndrome, these genes were less likely to be involved in the development of Alzheimer's disease. The findings, published in the scientific journal Nature, will help to explain the increased risk of Alzheimer's in people with Down syndrome, and may ultimately lead to new ways of treating the disease. Professor Stephen Fry, who led the study, said the team has already developed a test that detects the genetic differences between patients with Down syndrome and healthy individuals, allowing scientists to screen patients for the risk of Alzheimer's. "This will enable researchers to understand what causes this increased risk, and this should lead to new and more effective treatments to reduce the risk of Alzheimer's disease in people with Down syndrome," Professor Fry said. "It's now important to understand whether people with Down syndrome also have this instability in their DNA. As more is learnt about the instability in the genes of Down syndrome, we can better understand the underlying causes of the increased risk of Alzheimer's disease in Down syndrome," he said. Professor Fry said because Down syndrome does not occur in the population at large, the researchers found that, on average, every individual has more than 500,000 sites on their DNA that are susceptible to genetic changes. "It is often said that people with Down syndrome have a twin of a person

The effect of three different drug treatment regimens on primary mammary tumors in female DBA/2 mice was studied. Mice were treated with methylcellulose microspheres containing 17.5 mg of tamoxifen, an antiestrogen. Microspheres were administered for 5 days beginning the day after the inoculation of mammary tumor cells. For control mice, one of the five daily doses of 5-fluorouracil (5-FU) was given by injection; the second group of animals received 17.5 mg of tamoxifen by mouth in addition to 5-FU
