DynaSec is a project in the works that intends to provide key generation, decryption, and packet sniffing in a highly portable and object-oriented fashion. While key generation is done using the X.509 RSA and ECC algorithms, the actual algorithms used to decrypt and sniff packets are kept flexible to support other implementations. DynaSec is built on top of a system called, "Openssl". Openssl is a secure C implementation of the SSL/TLS protocols. Openssl is a home grown implementation of the SSL/TLS protocol, and fully supports the RFC 2246 and RFC 2511 protocols. Openssl offers various features not currently found in other SSL implementations. Openssl supports the following features: * Completely free implementation of SSL/TLS * Support for certificate and RSA key servers * Support for Windows and Unix line based socket interfaces * Support for cipher suites and protocols not supported by other implementations * Dynamically loadable libraries * Line based socket support for Windows NT and Unix (meaning that the sockets will be opened and closed on program exit) * Full access to the file system for embedded systems * Standard stream based socket support * Text mode console support for embedded systems * Static link support

What's New In?

Burg is a user-friendly menu and taskbar application for Linux and other desktop operating systems. It has built-in support for non-standard keyboard shortcuts, works with the system tray, and provides configurable menus that allow you to organize your favorite icons and commands in a way that best suits your own setup. You can read more here. A: A lot of the other answers are about KDE. I think KDE's "System Tray Indicator" is useful and lots of other distros do it too. There are other ways of doing it as well, but I'll just describe one. You can use the "Notifyd" (notify) daemon to create a daemon that checks for events and displays the notifications. Install "notify-send" and "notify-python" packages. Install Notifyd in Ubuntu, using: sudo apt-get install notify-send Start Notifyd in Ubuntu: sudo service notifyd start In another shell, test that Notifyd is running: $ ps ax | grep notify 2958 pts/2 S+ 0:00 _ grep --color=auto notify 2959? S 0:00 _ grep --color=auto notify In the above, I start the daemon and then search for the daemon in /proc//stat. The PID is the process ID (psid). You can use pidof to find it. Now we will update our notification script to use Notifyd. We first check the Notifyd daemon is running. If it isn't, we display a welcome message and exit. Notice that we did not print "Welcome to My Program" or "Bye". I don't want to bore you with unimportant details. #!/bin/bash # # Check that the Notifyd daemon is running if [-z $DAEMON]; then echo "Welcome to my program. Notifyd not running" exit 0 fi Notify
