with a series of scrambled and randomly generated letters and numbers to confuse or obfuscate anyone who looks at the source code. CodeTangler obfuscates source code by removing any comments and documentation within the source code, renames all functions, classes, and variables, strips whitespace, clears line breaks, and transforms string literals into hexadecimal form and a series of character codes. Other features: It also provides a search and replace utility as well as a "decode" function, all available by default. First of all, I'm not too excited about the idea of obfuscation, I don't think it's healthy to really protect your code by that method. Code obfuscation is used by viruses and hackers to cover up and conceal their code. This is not the purpose of it. But the good news is that the software itself does not hide the real source code, only obfuscates it. CodeTangler supports all the most standard PHP functions. It also has an extra feature, which is to remove comments and documentation. But this is only a feature, not something that's designed to prevent reading the source code. Besides, all the texts you entered are just for demonstration, please don't use them in your own project. Page Loads and Storing Data Obfuscating the source code does not mean the data a69d392a70
