Category:Air conditioning Category:ASHRAEAcceleration of electrically evoked auditory brainstem responses in infancy: potential implications for prelinguistic speech processing. Recent evidence suggests that the auditory brainstem response (ABR) responds to acoustic signals in infancy. The present study examines the possible emergence of this response to acoustic information in humans, specifically with respect to the neural substrate subserving speech perception. For this purpose, ABRs were recorded to an 80-dB acoustic probe at 1, 2, 4, and 10 kHz in a group of 11- to 12-month-old infants. A 100-Hz electrical stimulus was applied at latencies corresponding to the 20- to 80-dB characteristic frequency (CF) range. The results show that a sub-group of infants (4 of 11) has a response to electrical stimuli that exists for a discrete range of CFs, at the highest of which the CF matches the CF of the acoustic stimulus. This response was not observed in any of the other infants. These findings suggest that the brainstem response to acoustic information may be present in some infants as early as the second month of life. In numerous technological fields, the possibility of obtaining products based on activated carbon is known. This type of product can be used as a temporary material for manufacturing items in various fields such as molding, gaskets, and in filling agents. When manufacturing an activated carbon-based product, the activated carbon is dried and micronized. This micronized activated carbon is then mixed with a resin material in order to form a molded product. The resin material commonly used in molding the activated carbon is an unsaturated polyester. In the procedure described above, it is necessary to use an excess of resin material. Consequently, the manufacturing costs are high, since there is a need to either dispose of a large amount of resin material that is not used, or else charge customers at an additional cost for the resin material. Furthermore, in the resin material used, the presence of volatile components is more than 50% by weight. This volatile component content is also problematic, since it can induce health problems and reduce the lifetime of the mold. In order to alleviate the problems of excess resin material 3da54e8ca3
