She's also a Russian spy for the US government (as proven by her "dead brother"). She needs to decide what she's willing to risk for her own life, and for the life of her daughter. Viper: So, there will be a full-blown war between Russia and the US? Lunatic: No. Russia is going to invade and occupy the sovereign territory of several countries, and the US will eventually realize that their world is about to be destroyed and they will actively intervene to stop the Russian government from committing genocide. Viper: What kind of man would you want to marry? Lunatic: someone who doesn't think they're special. Someone who has a sense of humor and will have patience with me, someone who is kind and doesn't think they can do anything right or wrong. Viper: Who do you see yourself in 10 years? Lunatic: Someone who is an amazing mother to my daughter and a great wife.Q: Get data from SQL Server in Haxe I have some data in the SQL Server and I need to get it and use it, this is the select part of my code: const sqlStatement = ` SELECT * FROM customers `; trace(SqlConnection.run(sqlStatement)); Data from the database for example: name, surname, age, is_active And this is part of the code that I would like to use this data: Text personName; Text personSurname

I'm aware you can't (directly) override a virtual method from a

child class, but I was wondering if you could if you were to make the base class abstract. My understanding is that, if a child class of a parent class is abstract, then the base class cannot be instantiated and therefore it cannot call the child class's (non-abstract) method. It just dies and grinds to a halt; every object in that class is deleted, and the "illusion" of the method being called from a valid, live object has vanished. So, does this mean that if we were to declare the base class abstract, then we can't ever actually instantiate a parent class that doesn't already make at least one of its virtual methods abstract, because the parent class' abstract method would be a 0-cost stub calling its non-abstract method? Or would the stub be able to call its own non-abstract method? A: I'm aware you can't (directly) override a virtual method from a child class, but I was wondering if you could if you were to make the base class abstract. If you use "make the base class abstract" in this way, then yes, the method will indeed be overridden. In order for the class to be abstract, it does not require any of its methods to be virtual. Any non-abstract method that is used will be virtual when it is compiled. Since the method is virtual, you would override it in any descendent class. However, the implementation of the method in the abstract class cannot be an override, since it cannot be non-virtual. So, does this mean that
