SEP 16, 1991 Appeal From: W.D.La., N.D. 1 AFFIRMED. \* Fed.R.App.P. 34(a); 5th Cir.R. 34.2 Q: Number of ways to distribute n items amongst 4 receivers How to find number of ways to distribute n

items amongst 4 receivers? like A: One way to think about the problem is to generate all the possibilities and subtract from that the ones that are invalid (unable to fulfill the requirements). A valid assignment is one that can be accomplished in a way so that each receiver gets exactly \$4\$ items. The total number of possibilities is  $4^n$ , since we have  $n$  items that are available to distribute  $4$  ways. The corresponding subsets of this set is the set of all the ways that we can distribute each item to one of the receivers so that there are exactly  $4$  items per receiver. The subset corresponding to getting  $4$  items for each receiver is  $[4]^n$ . This is the number of ways we can arrange  $4$  items on a line. (see enumeration here) The subset corresponding to each of the three receivers getting exactly  $3$  items is  $[3]\cdot[4]^n$ . The subset corresponding to each of the two receivers getting exactly  $2$  items is  $[2]\cdot[3]\cdot[4]$
