Wondershare.Q:

Why isn't using
entities harder to
test than using
objects? I was
reading an article
about testing, and
I read that it is

hard to test a non-readable method, so that's why programmers tend to use objects (objects make it easier to test). However, I was wondering why isn't using entities that much harder than using

objects? I mean, I can see they are easier to edit and to use, so why do you make such a big deal of testing them? Is it that only when they have methods that do not have any other reasonable way of using them

(for example, trying to find the problem before finding out that the code has no valid business rule), they require testing? A: Entities are hard to test for a very simple reason: they are too big. By "big" I

mean it is virtually impossible to test them all at once. You need to break them down into smaller parts that you can test at once. This is easier when testing with objects and one object at a time.

On the other hand, if entities are too big, you can't be sure that every field is correctly validated, whether a getter or setter is actually overridden, etc. The State Department cautioned Monday that U.S. national
