Examination of the developmental progression of innate immune cells in murine bone marrow-derived macrophages. Innate immune cells are required during early embryogenesis and organogenesis and have an essential role in the establishment of immune tolerance. Although the origin of macrophages and dendritic cells in the embryo is now well defined, the role of macrophages in immunity and inflammatory processes is well known. The aim of this study was to examine the expression of classical surface molecules and cytotoxicity of murine bone marrow-derived macrophages (BMMs) that were generated at two distinct stages of embryonic development. The data suggest that macrophage development is controlled by the lineage rather than the stage of origin. At day 14 of embryonic development, the cells expressed CD11b, CD45R, F4/80 and macrophage receptors scavenger receptors (SR-A1 and CD36). When challenged with bacteria,
