i believe that anyone with the slightest knowledge of plastic explosive devices could identify this from the description, and of course a high degree of probability exists that forensic science was also used which has come a long way in the past 20 years. i have received on email that someone asked me if i ever thought of reading the anti-book files i had sent out to other people by way of pdf. this is an odd question, because i have always read them. these are thousands of pages of pdf documents, plus others. some are law books, some manuals, some anti-science, anti-everything documents. i have now received more than 250,000 anti-book files and i am not going to answer any questions about what they say, other than they include the full text of the anti fundamentalist bible, the fabian science manual, the anti-measure math manual, and many more. they can be downloaded from my site, kennetthomas.com i once asked an individual who i was speaking with about his background. i was trying to establish where he could be from and why he was so anti but not sure i was getting anywhere. after a minute of listening, he suddenly said, i have my own body armour on. its all in there. i replied, ok, is there something in there that will tell me why? he then explained that the kit he had was all his own. he had to go through many battles in his life and had been discovered using evidence. however, what is more tempting than an fpga is a field programmable gate array (fpga), an integrated circuit consisting of programmable logic and programmable interconnects. these programs can be programmed by a design engineer to carry out certain functions. the advantages of fpgas are many. programming, debugging, and testing are much easier than on a programmable chip. also with the rise in the popularity of neural networks these chips are being used more frequently. the market for the chips is huge and so is the variety of the chips on the market. another advantage of using fpgas is the electronic design automation (eda) tools. they can simulate the functioning of a circuit, perform timing analysis, optimize power, and perform circuit synthesis. however, the disadvantages are that the price is not cheap and the size is very big.

if ssl works fine with aes in cbc and sha-256 for md5 and sha-1 and sha-2 hashes, why is it so insecure? the problem with sha-1 and sha-2 is that both require a large hash size (in bits) such as 512, and both are patented with patents expiring in the next few years. cryptography requires that a crypting algorithm is public so that it can be understood and inspected by the intended user. this is a much different process from a secret or a key. with a secret or key there is no need for a public algorithm but with a public algorithm what a person is supposed to do is create a message that is to be secret, such as, sensitive or private information. the person encrypts the message with a secret/key and decrypts it with the secret/key to extract the message. if an algorithm is public and the message is to be secret (ie: not publicly available) then only one secret and one public algorithm is possible. this is why we have the following public algorithms. they are not secret and their secret application can be uncovered, such as sha-1. they are also patented and expire soon, such as sha-1. 1. md4: this algorithm is a hash algorithm which is very similar to sha-1. the length of the hash is 128 bit with a 64 bit result. the algorithm is patented and expires in 2009. md4 has been cracked within one hour (refer https://www.ncss.nist.gov/crypto/md4.html) of its inception. md5: this algorithm is a sha-1 replacement. it is a hash algorithm which has been cracked and altered to extend a secret key to 128 bits by using a combination of shamir's secret sharing and mceliece's public key cryptosystem. it has been cracked and altered to extend a secret key to 128 bits by using a combination of shamir's secret sharing and mceliece's public key cryptosystem. this algorithm will expire in 2009. 5ec8ef588b
