The **Clipboard Brush** helps you actually copy any selection to the clipboard. After that, you can paste it back to the image and it will keep the original settings. iPhoto has sure seen some positive upgrades and improvements, but I can't help thinking that it is simply too bloated to be considered a must-have application any more. When it comes to sequential editing, for example, we can't be sure if it preserves the original, even after doing some editing, as in some cases we may see double images in the same spot. We can also have a look at how the multi-window feature is working. The only thing I really like about iPhoto is the fact that there are quite few updates within the application. I am not a big fan of Apple's new dark OS, so I won't even try to make it look good either. That's not to say that you won't be able to edit your images properly in iPhoto, just that I feel that the application is cluttered. I also feel a little bit disappointed that there is no fresh way to search through all of your iPhoto library. iPhoto's new Create Actions feature is a nice addition, but again, it feels like Apple's implementation is nothing more than a copy paste of the existing iPhoto functionality with a fresh coat of paint. One other highlight of this update is the separation of layers, which is a change that most likely will make a great deal of sense. The Big One is that Photoshop now includes what Apple calls 'Live Filters', or filters that are live, but not automatic. This makes them one of the various advantages that iOS has over other platforms, and among the ways in which

it has been maintained even after its debut. There are other features of the application, including the addition of the Project Panel, which is a 3D model-based image editor.
