Several situations are excluded by Eq. [(\ref{eqn})]{} and, therefore, should possibly be excluded by the numerical solutions. The perturbation parameter  $d$  is the *maximum* of the coefficients defining the matrix  $M$ , while the perturbation parameter  $\tau$  is *the smallest* of the coefficients defining the matrix  $M$ . Similarly, any quantity  $N$  needed to resolve the (slight) instabilities of the discretized problem, introduced by  $d, \tau$  should be related to  $M$ , rather than to the dimensionless parameters  $\epsilon_M$  and  $\epsilon$ . It is intuitively clear that this leads to a relation with the eigenvalues of  $M$ . It is not the case, however, that  $\tau$  is related
