You can select any of the Movie downloading service providers you prefer and continue with the download. You can even update your profile to let all your friends and family know about the service you prefer. Gallium-68 DOTATOC PET and Tc-99m HMPAO SPECT/CT in patients with histopathologically confirmed metastases of neuroendocrine neoplasms to the liver: first clinical experience. Gallium-68 (68Ga) and technetium-99m hexamethylpropyleneamine-oxime (Tc-99m HMPAO) are used for imaging neuroendocrine tumors (NETs), but have not been evaluated in combination in patients with liver NETs (possible NETs). The aim of this study was to determine the feasibility, specificity, and diagnostic efficacy of Gallium-68 DOTATOC PET and Tc-99m HMPAO SPECT/CT in the diagnosis of NET liver metastases. For 57 patients, Gallium-68 DOTATOC PET and Tc-99m HMPAO SPECT/CT were carried out simultaneously. In addition, 68Ga-DOTATOC PET/CT was performed in 47 patients. Contrast-enhanced computed tomography (CT) or magnetic resonance imaging of the liver was performed at least 10 d prior to both examinations. Gallium-68 DOTATOC PET was positive in 18 patients (32%), Tc-99m HMPAO SPECT/CT in 34 patients (60%), and 68Ga-DOTATOC PET/CT in 25 patients (47%). In 8 patients (15%), both modalities were positive. CT was positive in 11 patients (20%), gallium-68 DOTATOC PET in 10 patients (18%), and Tc-99m HMPAO SPECT/CT in 7 patients (13%). In 10 patients (18%), CT was negative, gallium-68 DOTATOC PET was negative, and Tc-99m HMPAO SPECT/CT was positive. In 4 patients (7%), none of the modalities were positive. In 4 patients, 3 of whom had NETs, the definite diagnosis was confirmed by histology. In 4 patients with NETs, Tc-99m HMPAO SPECT/CT and 68Ga-DOTATOC PET/CT showed
