The present invention relates to a medical dressing, specifically an occlusive dressing, with an openable adhesive closure and a soft and flexible outer layer overlying the adhesive closure. Medical dressings for covering wounds are known. One commonly used design comprises an adhesive and soft outer layer applied to the wound. This outer layer, generally a gauze or fabric type material, may be self-adhering or may be laminated to an adhesive layer. This laminated combination may be removable for cleaning the wound, but may not be removed by a baby or small child. These dressings are available in both a non-occlusive and an occlusive version. Occlusive dressings may be useful for controlling wound exudate and maintaining moisture in a wound. Some known occlusive dressings have relatively bulky edges. This is particularly true with dressings such as Tegaderm, which has a relatively large perimeter and a flat adherent surface which
