Most people have heard of the Adobe Lightroom 5 app and have even used it on a Mac or a Windows machine. But an Android version of Lightroom is just as useful, if not even more so for those who are always on the go. In this review, I will show you why the Android Lightroom app is worth using and how it will make your life easier. Adobe says that you cannot remove apps from your Android tablet. This is largely true. (The cloud-based collection functionality is unaffected by this restriction, though.) So, you can't remove Lightroom from your tablet unless you manage to pull that off with a rooted device. You can remove apps and remove the App Drawer from root, but not without the use of Titanium Backup. Lightroom for Android supports 16.7 million images and 32 million preset collections. I found it works great. You can create a custom scrolling view by selecting images, then select a group name and scroll through images in that group. You can import without having to pick from a folder upload. These are some of the features that make Lightroom for Android so powerful. You can edit RAW photos with the same freedom as any RAW editor. However, I don't recommend you do this on a regular basis. The plugin offers only basic controls. You cannot apply masks, have extensive editing options, or use advanced control panel tools. This is probably why Lightroom is not the most popular "RAW" editor. You can save images in a maximum of 10 sizes, which you choose at Photo Settings | Save for Web, Print & Email... | Web. There is no limit on the number of resolutions, but there is a limit of 200 JPEG images. You can assign a watermark or logo to the image. Save Settings > Metadata always has the option to view or edit image details without having to go to the main panel when adding new images. You can also add location metadata and there is a feature to use inside processing, allowing you to add time, place, or motion metadata. A Print & Email page has options to configure the camera's color space and output to the popular PDF format.

The hot new features for 2020 in Adobe Lightroom are AI intelligence on imaging, and Octopus color. It's smarter than you are about fixing colors and exposures, and some of the weirdest features are about creating the perfect new image from multiple images in Lightroom (like if you just took a picture of your coffee and a longer exposure of the steaming pour of coffee while your eyes were closed). The trick with boosting your images is to not boost, properly speaking, the basic color of the photo. Changes in color space all around the edges of the image can significantly affect the final result. Over the past few years, software has inherited the concept of boosting and deblurring as the way to go if you want to fix or finish an image. But with AI and Octopus, Adobe actually got its AI to do the deblurring and boosting for you. This means you don't have to pore over a million photos in Lightroom to figure out if it's the exposure or the flag that really needs you to change. The biggest new feature for 2020 is actually a brand new tool. It's a plugin for the software called Retouch 4.0. It's a tool that will let you blend different photos together into one great image. It's made possible by the latest version of the group changes document, CcWG (color corrections with workflow groups). It's a group of tools you can use to improve your images. The latest version focuses on two basic things, camera and retouching. Photoshop is a great photo editing tool, but sometimes it's hard to get things just right. Lightroom is not as capable of dodging and burning details as the full Photoshop tool. Photoshop Elements can do clever things like merge multiple images into one, but it's tough to do all the processing needed for that photo.

As the desktop application evolves and Adobe Create is released for web designers, Photoshop users can now begin editing images in a Web browser using a host of powerful new tools and workflows. Adobe (“Create”) Creative Suite 5 product offerings will be available to the public in early September. Create allows designers to edit their images in the Web browser, creating much more powerful web graphics using a simple interface comparable to the desktop experience. With the new Photomerge Merge to HDR feature, images can be processed individually or as a group to significantly increase exposure without applying unnecessary and time-intensive light sources. By using Merge to HDR, Photoshop can now generate high dynamic range (HDR) files, and users can adjust the final result in Photoshop. Adobe’s Photosynth technology makes it possible to view a panoramic scene in a single image. It was an important requirement for photosynth functionality, and the new version of Photoshop, an Adobe product, now offers photomerge, a new feature that can be used to stitch photos together as a photo in a single image. Photoshop CS5 offers more than 80 blending modes that make it easy to smooth and sharpen the edges of an image. Along with the new blending modes, the update adds several new features to increase the flexibility and range of blending modes available to designers, including an enhanced bleaching mode, to easily remove noise and defects in a lens after it is used.
